

Features & Benefits

4-point attachments on both pelvic harness and Pelvic Cradle ensure they stay in the correct anatomical position for optimum support.

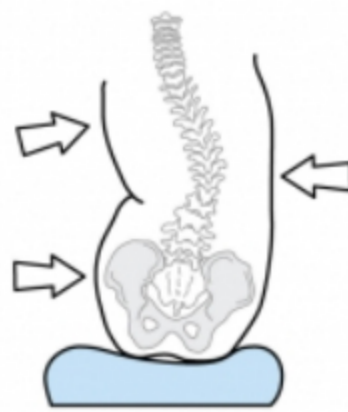

Flexible sacral support assists in the correction or accommodation of pelvic tilt.

Hip guides provide midline positioning and lateral support, and can be off-set to accommodate asymmetries.

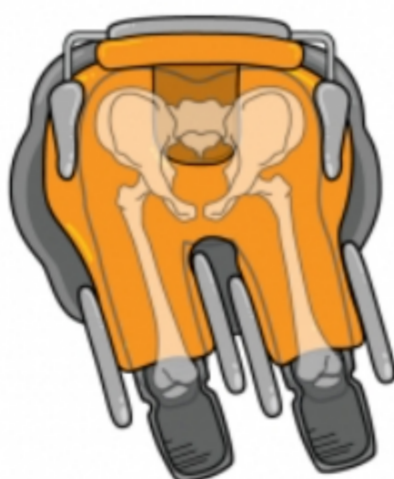

Back angle adjusts from the anatomically correct position ensuring lateral supports stay in the appropriate place when the seat back is reclined.

Flexible scoliosis can be managed by using the lateral supports in conjunction with the pelvic harness to provide 3-point positioning.

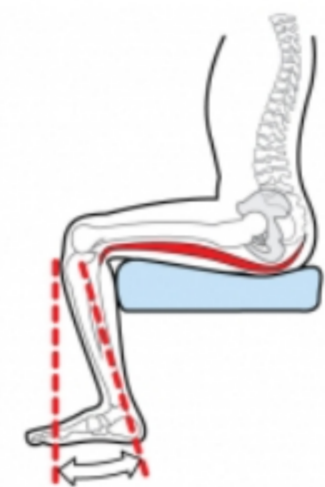

Mygo can be fitted with a chest pad or harness depending on the level of additional trunk support required.

The split seat base enables windsweeping postures to be accommodated. A range of up to 13° abduction and 10° adduction may be achieved, whilst offsetting the hip guides can aid in accommodating more extreme windsweeping.

The leg guides can be adjusted for leg length differences including those caused by a fixed pelvic rotation.

The foot supports can be positioned behind the knees taking the strain off tight hamstrings and promoting pelvic stability.
